

Climate Neutral Network

Are you a government leader committed to sustainability? A city official trying to solve the urban pollution problem? A business executive looking into ways to cut down on energy bills? Or a non-profit worker concerned with your organization's carbon footprint? If the answer is yes, then the Climate Neutral Network is the place for you.

Launched in February 2008, the Climate Neutral Network (CN Net) is the initiative of the United Nations Environment Programme (UNEP) to promote national, regional and global action and involvement in climate neutrality at all levels of society.

Based on an interactive website, the CN Net gives participants a platform to present their strategies in climate neutrality to the world, providing visibility and inspiring others. It functions as a network for information exchange and sharing of practical experiences, making the best available knowledge on climate neutrality widely available to all.

Today, the CN Net numbers among its participants countries, cities, major international companies, UN agencies and leading NGOs. They are the trailblazers on the route to zero emission economies, communities and businesses.

Don't be the odd one out!

CN Net participants have set the most ambitious greenhouse gas reduction targets in the world.

- Costa Rica aims to be climate neutral by 2021 when it celebrates 200 years of independence.
- Växjö in Sweden has decided to become a 'Fossil Fuel Free' City
- In Rizhao, China close to 100% of urban housing has solar heaters.
- Toyota Motors Europe is committed to sustainable mobility with the aim of "zero emissions".
- French NGO Planète Urgence offsets all emissions resulting from its operations and carries out reforestation projects in developing countries.
- UNEP has the United Nations lead on matters related to reducing greenhouse gas emissions; it was the first intergovernmental organisation to be featured on the Network.

The CN Net website provides easily searchable information on increased energy efficiency, reduced emissions and the use of clean and renewable energy. Its information is relevant to sectors as diverse as construction, tourism, agrifood and information and communication technologies.

CN Net participants are already achieving significant cuts in greenhouse gas emissions. As the Network grows and expands, so will its contribution to global efforts to combat climate change. JOIN TODAY!

Participation in the CN Net is free of charge. Full details can be found online at <http://www.unep.org/climateneutral>.
