

melting ice a **hot** topic?

ask a tourist

Warming in this century is projected to be between 1.4 and 5.8 °C. The impacts of climate change are already visible. Examples include: the shrinking Arctic ice cap; accelerating sea level rise; receding glaciers worldwide; thawing permafrost; earlier break-up of river and lake ice; increasing intensity and duration of tropical storms; lengthening of mid- to high-latitude growing seasons; and shifts in plant and animal ranges and behaviour.
